

## Project 2 — Open source launchpad for graphql-gene

---

**Client/Company name:** Elio Tax

**Website:** <https://www.elio-tax.com>

### Project title

Open source launchpad & developer ecosystem for graphql-gene

### Problem definition

graphql-gene is our open-source GraphQL tooling. Pursuing B2B partnerships with accounting firms—organizations that handle highly sensitive tax data—means engineering credibility weighs as heavily as roadmap slides. To support partner trust and a credible engineering brand, we need more than an npm package: a professional public hub — documentation, narrative, and a path toward community—that shows how we build and maintain quality systems.

Students work on turning the library into the foundation of a “tech brand”: clear docs, coherent messaging, and a strategy for sustainable growth—not only code. It is also a hands-on chance to contribute to open source: documentation, examples, and other hub work ship in the public repo for the wider community to reuse.

### Success criteria

- A modern documentation / marketing site (structure, branding, core pages) that explains what graphql-gene is and why it matters.
- Codified guidance on GraphQL schema design (using our standards as input), written so external developers can adopt it.
- Concrete ideas (and prototypes if time allows) for automation: e.g. lint rules, checklists, or AI-oriented helpers that encode those practices.
- A short growth / DevRel appendix: e.g. how Discord, blog, or video content could amplify the hub—prioritized so the team isn’t overloaded.

### Specific requirements or constraints

- Implement the hub with Nuxt.js (Vue.js) and Typescript.
- Deploy on Cloudflare—either SSR on Cloudflare Workers or a static build on Cloudflare Pages.
- Author content primarily in Markdown, with room to enrich pages using interactive Vue components where static prose is not enough.
  - Markdown-forward docs deliberately support AI context: documentation stays easy to chunk, summarize, and feed into tooling such as AI skills, which helps assistants generate grounded graphql-gene snippets instead of hallucinating APIs.
- Must respect accuracy: docs and benchmarks should not overclaim; cite methodology.

### Skillsets needed in the team

- Frontend
- Technical writing / information architecture

- GraphQL familiarity (schemas, queries) or keen to learn

## Additional resources for participants

- **graphql-gene** — Automatically generates an executable GraphQL schema from your ORM models.
    - <https://www.npmjs.com/package/graphql-gene>
    - <https://github.com/accesimpot/graphql-gene>
  - **Version context:** We are working on a new major version of graphql-gene with a few improvements driven by what we learned running it in production over the past six months. The documentation should match v2's updated query syntax.
    - [https://github.com/accesimpot/graphql-gene/blob/e473e26fcae174080d4af95797a9e9832718e408/PLAN\\_V2.md#25-list-vs-single-association-wrapper-and-one-level-of-metadata](https://github.com/accesimpot/graphql-gene/blob/e473e26fcae174080d4af95797a9e9832718e408/PLAN_V2.md#25-list-vs-single-association-wrapper-and-one-level-of-metadata)
  - **Kickoff materials:** documentation copy, GraphQL / API design norms, and curated best-practice notes will be **provided at project start**—the team shapes the site and narrative from that baseline rather than inventing it from scratch.
  - **Contact for questions:** prefer **Slack** when possible
